Community-driven research

Catchment area driven research

Community approaches

Community- based participatory

# Community-based Participatory Research

CBPR is “a collaborative process that equitably involves all partners in the research process and recognizes the unique strengths that each brings. CBPR begins with a research topic of importance to the community with the aim of combining knowledge and action for social change to improve community health and eliminate health disparities.”

–kellogg community health Scholars Program (2001)

# CBPR principles

Recognizes community as a unit of identity.

Builds on strengths and resources within the community.

Facilitates a collaborative, equitable partnership in all phases of research, involving an empowering and power-sharing process that attends to social inequalities.

Fosters co-learning and capacity building among all partners.

Integrates and achieves a balance between knowledge generation and intervention for the mutual benefit of all partners.

Focuses on the local relevance of public health problems and on ecological perspectives to attend to the determinants of health.

Involves systems development using a cyclical and iterative process.

Disseminates results to all partners and involves them in the wider dissemination of results.

Involves a long-term process and commitment to sustainability.

Openly addresses issues of race, ethnicity, racism, and social class, and embodies “cultural humility.”

Works to ensure research rigor and validity but also seeks to “broaden the bandwidth of validity” with respect to research relevance.

# Participatory research

- Participatory research is the co-construction of research between researchers and people affected by the issues under study.
- Participatory research strengthens relations between the community and academia, ensures the relevancy of research questions, and increases community's capacity to identify and solve their problems.
- Participatory research seeks to move from conducting research “on” communities to conducting research “with” communities, and as such, represents a paradigm shift that better enables health research with different populations.

Case 1:  
Addressing smoking cessation among Latinos

# Smoking prevalence among Latinos by country of birth

# Why Latinos?

- 17% of population → 30% by the year 2060
- ↓ have access to healthcare
- ↓ advice to quit smoking
- ↓ use of counseling and medication
- ↓ participate in studies
  - Cultural and linguistic sensitivity
  - Non-daily or light smokers

# How to treat smoking?

## **Clinical Practice Guideline**

---

# **Treating Tobacco Use and Dependence: 2008 Update**

Michael C. Fiore, MD, MPH

The combination of counseling and medication is the most effective treatment for treating tobacco use and dependence

# How to treat smoking?

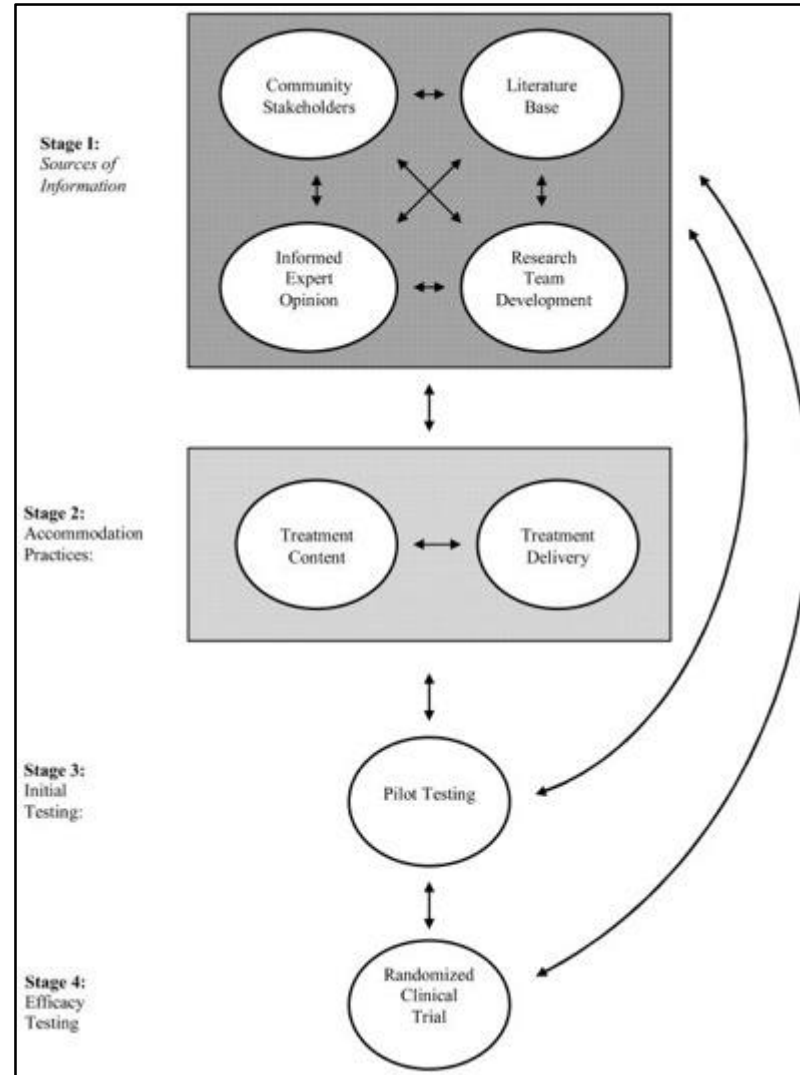

- Smoking cessation text messaging interventions are effective for smoking cessation.
- However, these interventions have not been studied among Latinos.
- The effect of these interventions among among hard-to-reach, socioeconomically disadvantaged, and uninsured populations may be greater.

# How to tailor an intervention?

# Initial testing to efficacy testing

**Text messaging** support for Latino smokers (n=20).

- **Low pharmacotherapy use.**
- **High text messaging interactivity:** Participants sent 31.8 text messages during the 12-week period (in Text2Quit participants sent 11.8 text messages during a 6-month period).
- At 12 weeks, **30% of participants quit smoking using intent-to-treat analysis** (88% follow-up rate).
- **Need for cultural and linguistic adaptation.**

**Paula Cupertino**  
(Principal Investigator)

## Text messaging support for Latino smokers (n=50).

- Pharmacotherapy use (a total of **100% of participants requested NRT at baseline** to support their quit attempt and **66% requested the refill**).
- **High text messaging interactivity:** Participants sent 31.8 text messages during the 12-week period (in Text2Quit participants sent 11.8 and 28.4 text messages during a 6-month period).
- At 12 weeks, **30% of participants quit smoking using intent-to-treat analysis** (88% follow-up rate).

# Decídetexto: Mobile Cessation Support for Latino Smokers

NCI R01CA212189  
Paula Cupertino  
(Principal Investigator)

**Aim:** Evaluate impact of Decídetexto, a culturally accommodated program (24 week), VS standard care on smoking abstinence at month 6 among Latino smokers

**Decídetexto incorporates two elements:**

- ▶ A tablet-based decision-making session.
- ▶ A text messaging program.

**Project Title:** Advancing smoking cessation in Latinos living with HIV one text at a time

**Cancer Prevention Statement:** Latino smokers living with HIV face difficulties in quitting smoking. More intense interventions for smoking cessation among this population are needed to prevent cancer. This proposal aims to adapt, and pilot test a smoking cessation text messaging intervention to Latinos living with HIV.

**General Audience Summary:** The life expectancy of people living with HIV (PLWH) has increased. However, improved survival is tempered by rises in cancer, most notably lung cancer. This increase is partly attributable to high smoking rates among PLWH (more than twice that of the general population). Latinos, the largest and fastest growing minority group, represent 15% of the U.S. population, but account for 25% of new HIV cases. Moreover, Latinos are less likely than non-Hispanic whites to have access to preventive resources and healthcare for HIV and smoking. Overcoming the burden of tobacco use among Latinos living with HIV demands affordable, accessible, and culturally congruent solutions. Evidence supports the feasibility of smoking cessation interventions delivered via text messaging among PLWH; however, these interventions have not been formally tested among Latinos. Moreover, existing interventions do not adequately address the unique barriers to smoking cessation encountered by Latinos, such as language, low education and literacy levels, immigration stress, discrimination, etc.

**Semi-structured interviews with key leaders of community-based organizations (CBOs) and clinics serving people living with HIV.**

**Objective:** Understand the barriers and facilitators of smoking cessation among Latinos living with HIV.

| Level                 | Barriers  | Facilitators  |
|-----------------------|---|---|
| <b>Individual</b>     | Minimal understanding of the benefits of quitting smoking             | High participation in clinical trials<br>Good medication adherence      |
| <b>Interpersonal</b>  | Language barriers<br>Low social support                               | No smoking in social circles  |
| <b>Organizational</b> | Lack of smoking cessation resources<br>Lack of targeted interventions | First HIV care visit for smoking cessation<br>Culturally competent care |
| <b>Community</b>      | HIV and mental health stigma  | COVID-19 as an opportunity for smoking cessation                        |

# Our involvement with the school district

# Why vaping?

- In a cross-sectional survey conducted among a diverse sample of students in grades 7, 9, and 11 attending public schools in a low-income community in the U.S., current vaping prevalence was 19% (compared to 6% for cigarettes).
- Moreover, 55% of students were susceptible to future vaping (no differences by race and ethnicity).

# Why vaping?

- There is a lack of effective messages and communication channels to prevent initiation.
- Only two studies have assessed if messages can prevent vaping among adolescents and, if so, what messages and delivery formats may be most effective.
- One limitation of both studies is the lack of representation of Black and Latino adolescents.

# User-centered design

- A user-centered design is typically defined as “the need for a design that uses the natural properties of the individuals, exploiting the relationships and constraints and focusing on the needs and interests of the user, in order to make the final products usable and understandable”.
- We conducted a series of focus groups with sixteen Black and Latino adolescents to develop culturally and linguistically appropriate graphic messages for vaping prevention.

# Health reward

- Participants decided to create a message about the health consequences of vaping.
- Rather than developing a graphic message to scare teens by showing the negative health effects of vaping, participants decided to develop a message that resonates with their emotions.
- Participants suggested the graphic message to show a mother kissing her hospitalized son in the intensive care unit. Participants expressed that the idea of not letting their mother down was a very strong emotional deterrent for vaping.

# Health reward

# Lessons learned

- Far from looking at Black and Latino adolescents as “at-risk” or in need of knowledge, we welcomed them into our research as experts, as voices from the community needed to improve our practice, and as colleagues. Within this environment, adolescents may become conscience of their realities and envision themselves as agents of change capable of transforming communities.
- Adolescents added innovation and creativity to the development of culturally and linguistically appropriate graphic messages for vaping prevention.
- Appropriate staffing, funding, and approaches are key efforts to PR among Black and Latino adolescents.

Thank You!  
¡Muchas Gracias!
