

# Pediatric Peril: Managing A Child's Airway

Jeremy T Cushman, MD MS EMT-P FACEP FAEMS  
Associate Professor of Emergency Medicine and Public Health Sciences  
Chief, Division of Prehospital Medicine

---

---

---

---

---

---

---

---

## Today's Talk

### Goals:

- Identify best practices for positioning and suctioning the conscious child.
- Describe techniques to optimize ventilation of the unconscious child.
- Understand the challenges and risks to pediatric prehospital intubation.

### Disclosures

- None

---

---

---

---

---

---

---

---

## The Pediatric Airway

99% of pediatric airways in the out-of-hospital environment can be managed with:

- Positioning
- Suctioning
- Adjunct Use (OPA/NPA)
- Bag Valve Mask Ventilation

---

---

---

---

---

---

---

---

### Airway Differences in Kids

- Narrow nostrils, newborn obligate nose breather
- Occiput rounded
- Tongue relatively large for mouth
- Epiglottis omega-shaped and floppy
- Larynx higher in neck
- Vocal cords slant anteriorly
- Neck short
- Cricoid ring narrowest diameter

---

---

---

---

---

---

---

### Positioning

Braude, Shocket & Habrat, JEMS 2017

---

---

---

---

---

---

---

---

### Positioning

Braude, Shocket & Habrat, JEMS 2017

---

---

---

---

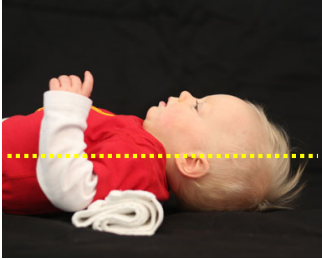

---

---

---

---

### Positioning

Braude, Shockel & Habrat, JEMS 2017

---

---

---

---

---

---

---

---

### The Problematic Airway

- Prominent adenoids, tonsils and a big tongue
- Loss of upper airway space
  - Obstruction during spontaneous ventilation
  - Difficulty with BVM
  - Sedatives result in loss of upper airway tone = upper airway obstruction

---

---

---

---

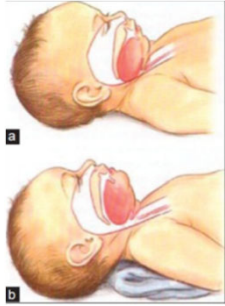

---

---

---

---

### Positioning

Harfens, Ramalab, Bhanacker, Int J Crit Illn by Sci 2014

---

---

---

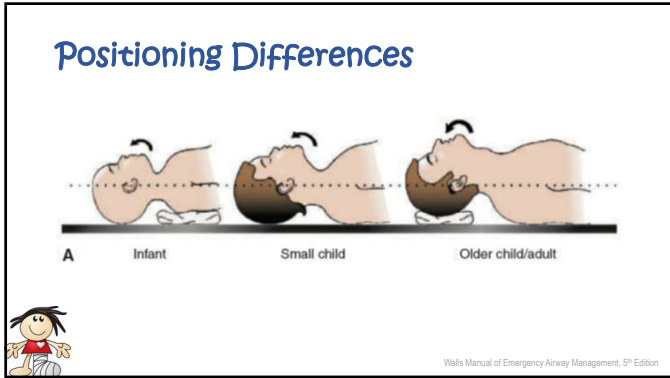

---

---

---

---

---

---

---

---

---

---

---

---

---

### The Breathing Child

- The nose/pharynx responsible for **50%** of airway resistance
  - Noses shorter, flatter, with small nares
- Obligate nasal breathers until ~ 5 months of age
- Blockage of nose = respiratory distress

A small cartoon character is in the bottom left corner.

---

---

---

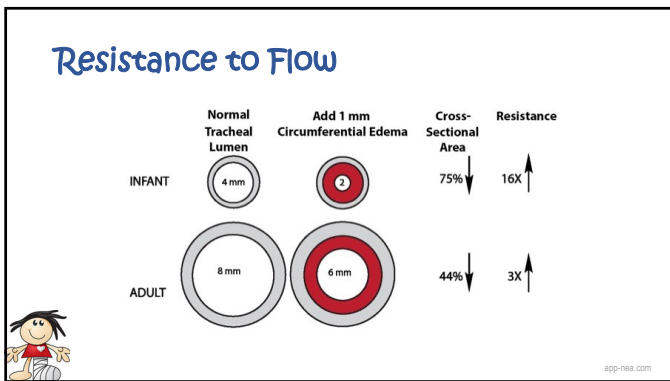

---

---

---

---

---

---

---

---

---

---

---

---

---

## The Breathing Child

- Compliant but non-ossified chest wall
  - Intrinsic muscle tone required to maintain lung volume and prevent chest wall distortion
  - More likely to experience respiratory muscle fatigue, atelectasis and failure
- Calcification of larynx and trachea not until teens
- Flexible cartilaginous rings dynamically obstruct with negative pressure ventilation

---

---

---

---

---

---

---

---

## The Breathing Child

---

---

---

---

---

---

---

---

## Suctioning

**Yes!**

**No!**

- |  |  |
|--|--|
| <ul style="list-style-type: none"> <li>• Unable to remove their own secretions</li> <li>• Secretion removal for children with bronchiolitis</li> </ul> | <ul style="list-style-type: none"> <li>• Able to clear secretions           <ul style="list-style-type: none"> <li>• Cough or blow nose</li> </ul> </li> <li>• Concern for croup or epiglottitis</li> <li>• Trauma to face (basilar skull fracture)</li> </ul> |
|--|--|

---

---

---

---

---

---

---

---

## Suctioning

Age	Size
Newborn	6 fr
6 month	8 fr
1-8 yr	10 fr
8 + yr	14 fr

---

---

---

---

---

---

---

---

## Suctioning Using a Bulb Syringe

• For infants < 6 months

---

---

---

---

---

---

---

---

## NP Suctioning

• Measure from tip of nose to earlobe

- You need:
  - Clean gloves
  - Suction catheter
  - Facemask with shield / surgical mask with eye protection
  - Surgi-lube
  - Saline drops

---

---

---

---

---

---

---

---

### Suctioning

- Place 2-3 saline drops in each nostril
- Lubricate tip of catheter with surgi-lube
- Insert catheter to measurement
- Initiate suction
- Pull back slowly while moving the catheter in a circular motion
- Never suction more than 5-10 seconds at a time

---

---

---

---

---

---

---

---

### Would YOU Like It Up YOUR Nose?

- Position of comfort until set up and ready to go
- Restrain only just before and during suctioning
- Explain procedure to parents if they are present
  - Child will scream and cry
- Make sure you have enough help prior to starting
- Comfort wrapping/swaddling "like a burrito" or "angel wrap"
- Singing, music, videos, distraction

---

---

---

---

---

---

---

---

### BVM Ventilation

- Small, fixed tidal volumes relative to body size
  - Susceptibility to iatrogenic barotrauma
- Mask seal and mask technique CRITICAL
- Both VOLUME and RATE of breath delivery important

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

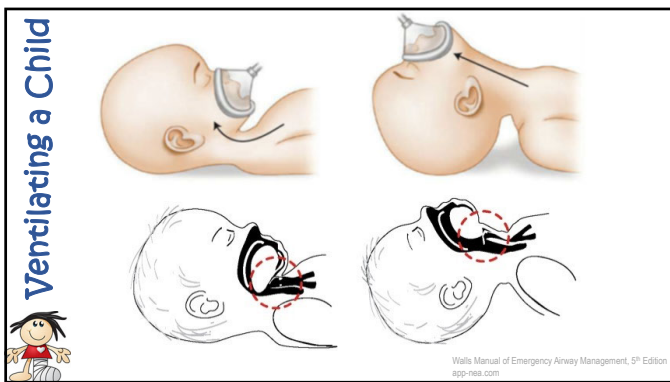

---

---

---

---

---

---

---

---

---

---

---

## BVM Ventilation Rate

Infant	Child	Adolescent
30-40	20-30	12-16
1 every 2 seconds	1 every 3 second	1 every 5 seconds

---

---

---

---

---

---

---

---

## BVM Ventilation Volume

Target= 5-8 ml/kg

Age	Weight (kg)	TV (5 ml/kg)	TV (8 ml/kg)
Birth	3.25	16.3	26
3 mo	6	30	48
6 mo	7.5	37.5	60
1 yr	10	50	80
2 yr	12	60	96
3 yr	14	70	112
4 yr	16	80	128
5 yr	18	90	144
6 yr	20	100	160
7 yr	22	110	176
10 yr	32.5	162.5	260

---

---

---

---

---

---

---

---

## Physiologic Differences in Kids

- Oxygen consumption greater than adult
  - 6 vs 3 mL/kg/min
- Lower functional residual capacity = rapid desaturation
- CO<sub>2</sub> production increased
  - 100-150 vs 60 mL/kg/min
  - Since TV (mL/kg) is consistent across ages, RR is higher in infants to maintain the minute ventilation necessary

---

---

---

---

---

---

---

---

# Prehospital Paramedic Endotracheal Intubation

No difference in survival

BVM: 123/404 [30%]

ETI: 110/416 [26%]

OR 0.82; [0.61-1.11]

No difference in neurologic outcome

BVM: 92/404 [23%]

ETI: 85/416 [20%]

OR 0.87; [0.62-1.22]

## Effect of Out-of-Hospital Pediatric Endotracheal Intubation on Survival and Neurological Outcome

### A Controlled Clinical Trial

**Background:** Endotracheal intubation (ETI) is used for airway management of children who are in respiratory distress, despite a lack of controlled data demonstrating a survival benefit or an effect on neurologic outcome of pediatric patients.

**Objectives:** To compare the effect of endotracheal intubation of pediatric patients, compared with bag-valve-mask ventilation (BVM) with those of patients treated with BVM.

**Design:** Controlled clinical trial, in which patients were assigned to interventions by randomization by computer software, through telephone.

**Setting:** Emergency medical services (EMS) agencies in the United States.

**Participants:** A total of 416 children (aged 1 to 18 years) or their parents or legal guardians who were contacted by telephone.

**Interventions:** Patients were assigned to receive either BVM (aged 1 to 18 years) or ETI (aged 1 to 18 years).

**Main Results:** Survival to hospital discharge and neurologic status at hospital discharge were similar between the 2 groups.

**Conclusions:** There was no difference in survival to hospital discharge or neurologic status at hospital discharge between patients who received BVM and those who received ETI.

---

# Prehospital Paramedic ETI

- Large ground system\*
  - 66% overall FPS
  - 53% infant FPS
  - 56% cardiac arrest FPS

• Many systems have removed Pediatric ETI

**Added Challenges!**

Syndrome	Airway Implication
Pierre robin sequence	Micrognathia, glossoptosis, cleft palate
Goldenhar syndrome	Micrognathia (unilateral), cervical dysfunction
Treacher Collins syndrome	Micrognathia, small oral opening, zygomatic hypoplasia
Apert syndrome	Limited cervical motion, macroglossia, micrognathia, midface hypoplasia
Hunter and Hurler syndromes	Cervical dysfunction, macroglossia
Beckwith-Wiedemann syndrome	Macroglossia
Freeman-Sheldon syndrome	Circumoral fibrosis, microstomia, limit cervical motion
Down syndrome	Atlantooccipital abnormalities, small oral cavity, macroglossia
Klippel-Feil syndrome	Cervical fusion
Hallermann-Streiff syndrome	Microstomia
Arthrogyria	Cervical dysfunction
Cri-du-chat syndrome	Micrognathia, laryngomalacia
Edwards syndrome	Micrognathia
Fibrodysplasia ossificans progressiva	Limited cervical motion

---

---

---

---

---

---

**To Cuff or Not to Cuff**

- Cuffed ETT provide better ventilating conditions
- Cuff pressure is critical
  - Median cuff pressure 40-60 cm H<sub>2</sub>O well exceeding target <20 cm H<sub>2</sub>O\*

\*Ong, et al Anesthesia 2008

---

---

---

---

---

---

---

---

---

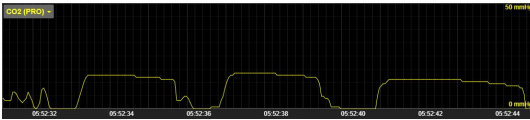

---

---

---

**The Pediatric Trachea**

- Its Short!  
(5 cm in neonate to ~ 12 cm in adult)
- Right mainstem intubation
- Inadvertent extubation

---

---

---

---

---

---

---

---

---

---

---

---

## Avoid Pediatric Peril

Practice, practice, practice...

- Positioning
- Suctioning
- Adjunct Use (OPA/NPA)
- Bag Valve Mask Ventilation

---

---

---

---

---
